

ABSTRACT

This invention is relative with a text displaying terminal unit used for preparation, transmission/ reception and display of a text message. A text message entered by a user is collated to a keyword and, if there is a keyword in the text, displaying attributes of the text and/or the background image are added to the text to send the resulting text added by the displaying attributes to a server (400). Alternatively, the server may collate the text to the keyword to add the displaying attributes of the text and/or the background image to the text. A receiving side terminal unit receives an XML document (240b), added by the displaying attributes, from the server to display the XML document added by the displaying attributes as a motion text message. This motion text message may also be provided by the server to the user as the Web information.
